場所細胞がたくさん集まると
空間のすべての領域をカバー

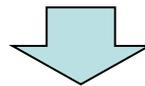

[日本神経科学会web]

Place Cell

- **Place cell:**
neurons activated when animals enter in a particular place.
[O'Keefe & Dostrovsky, 1971]
- **Grid cell:**
neurons activated at an equal distances.
[Fyhn et al., 2004, Hafting et al. 2005]

- 
- Mathematical models have been proposed that retain spatial representation.
 - Rats and infants are never told where they are.
 - No model where spatial representation is built from only visuo-motor experiences.

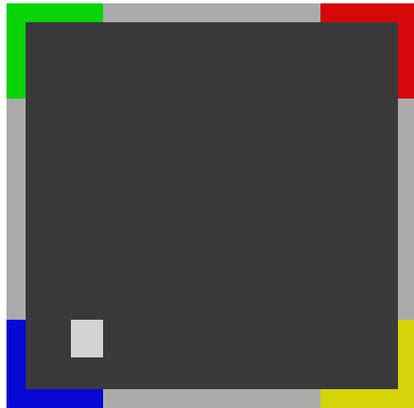

Simulation-based synthetic approach using deep neural networks

Predictive learning

- **Simulation environment**

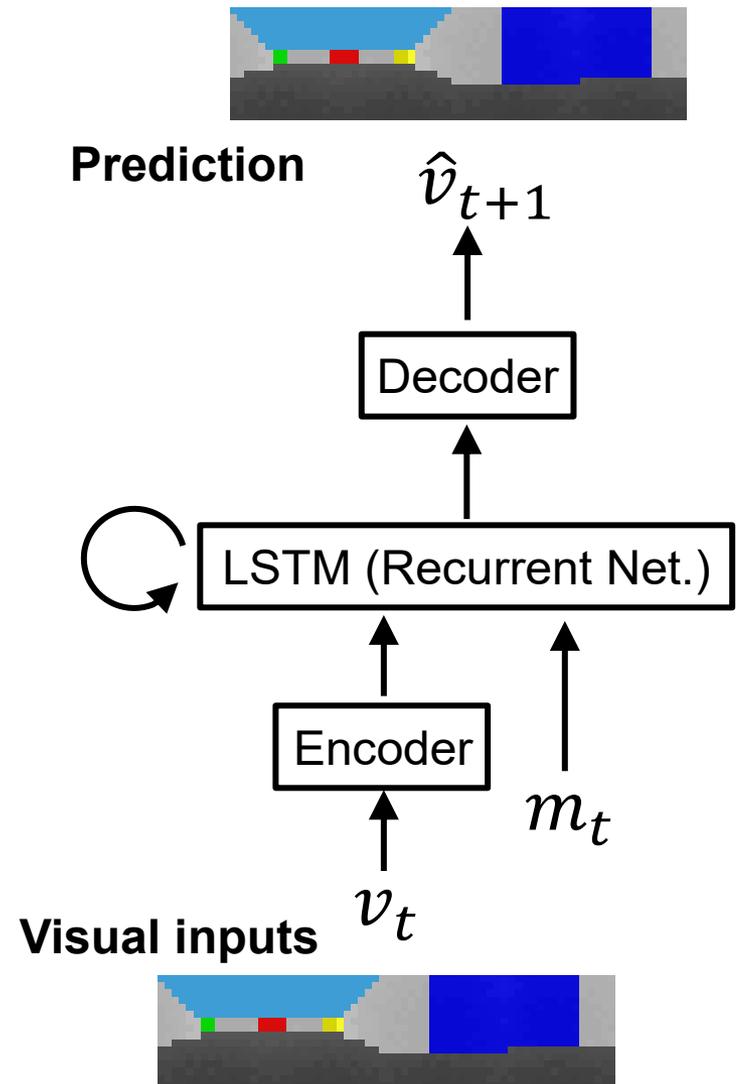

Agent : a robot moving around 2-D space

➤ **Four landmarks at the corners**

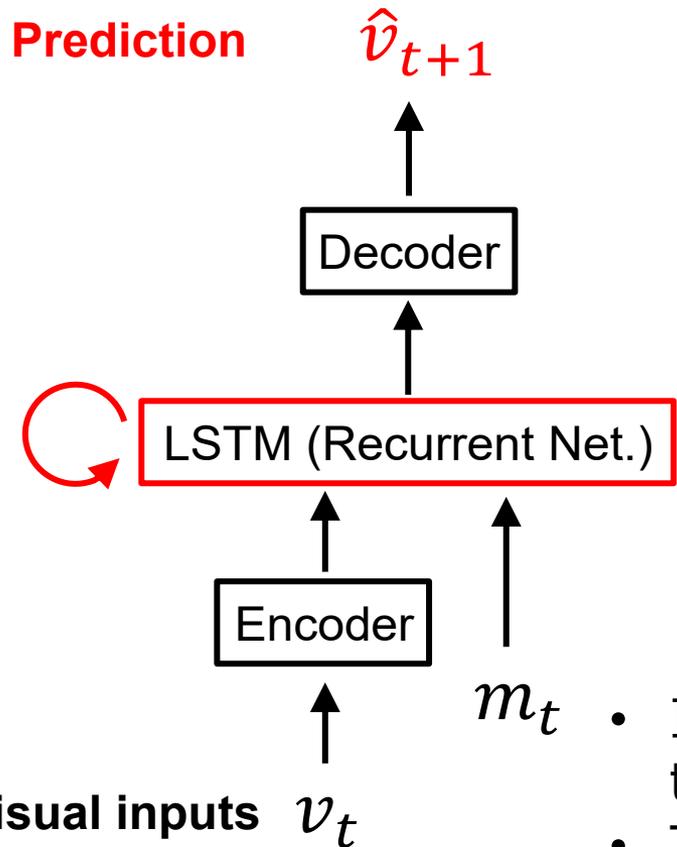

The neural network is trained to **predict** future visual inputs.

- **Neural network model**

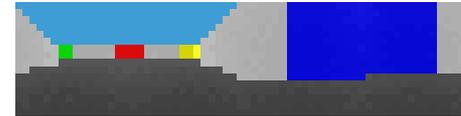

Visualizing internal states

Prediction performance

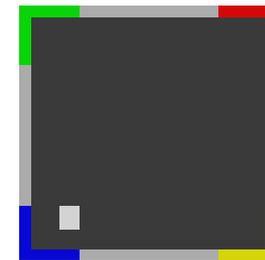

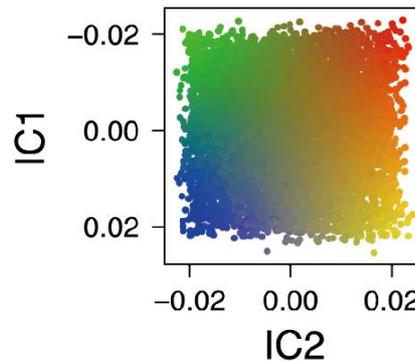

Ground Truth

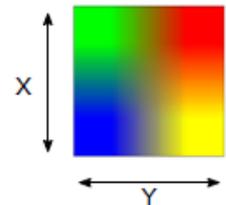

Prediction

Visualized internal states

Color map

- Internal states are stored in such a way that they correspond to the locations.
- Two dimensions enough same as spatial dimensions.

Visual inputs

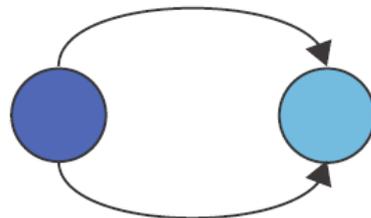

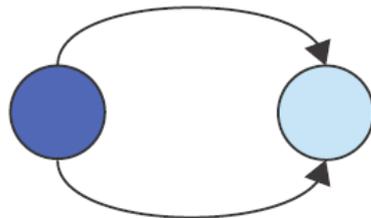

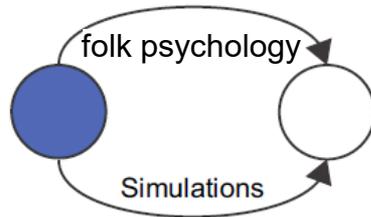

- **Distinction of self and others through superposition mechanism**
- **Propagating a mind from other to self via superposition mechanism**

How do we predict and explain other's behavior?

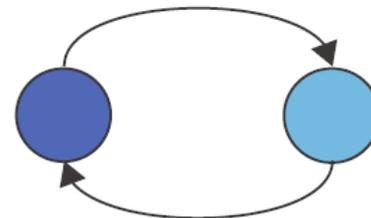

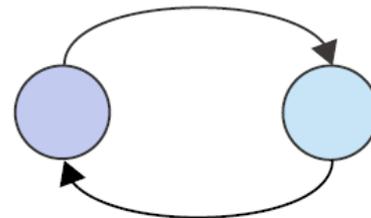

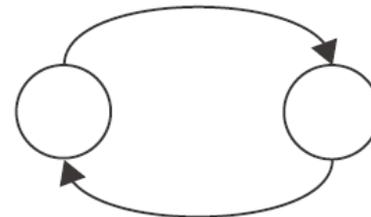

- Theory theory [Gopnik, 1994 ...]
 - Using implicit general knowledge called folk psychology
 - Knowledge-based inference using beliefs and desires
- Simulation theory [Gordon, 1986 ...]
 - Using its own model to simulate other's mental states.
 - Model-based inference
- Interaction theory [Gallagher, 2008 ...]
 - Criticizing the view of unilateral observation of others and making inferences about others' mental states
 - Ongoing interaction itself causes direct perception of others

Illustration of those approaches

Theory theory Simulation approach

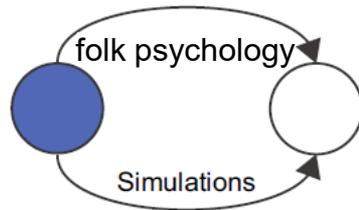

Interaction theory

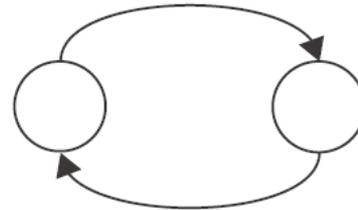

How can the pre-existing frameworks of self and others be formed?

No pre-existing frames of self and other

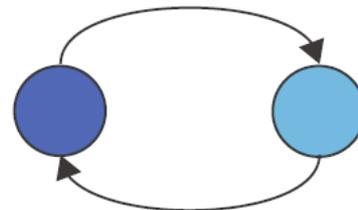

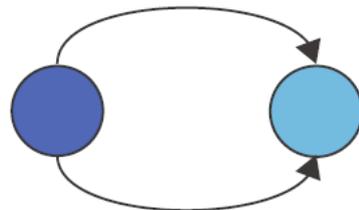

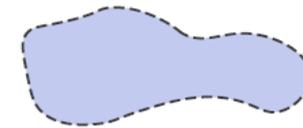

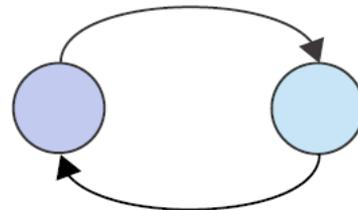

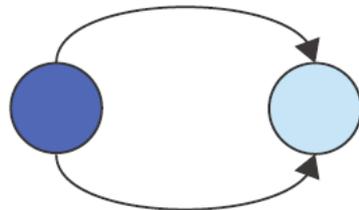

TT and ST

IT

Our idea

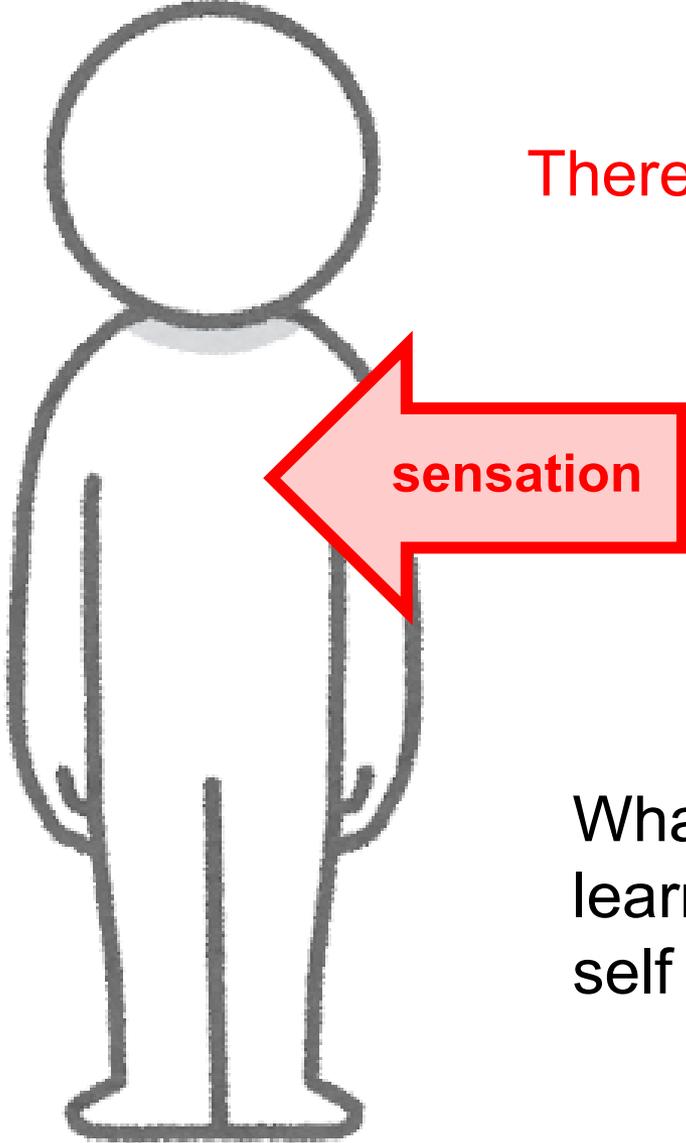

We assume

- there are no pre-existing frames of self and other.
- these concepts themselves are acquired through learning.
- starting from a situation where there is neither self nor other.

How we understand self and others?

There is no distinction between self and other.

sensation

Sensations are **nothing more than external stimuli**, even if they are considered belonging to a particular body from the third-person perspective.

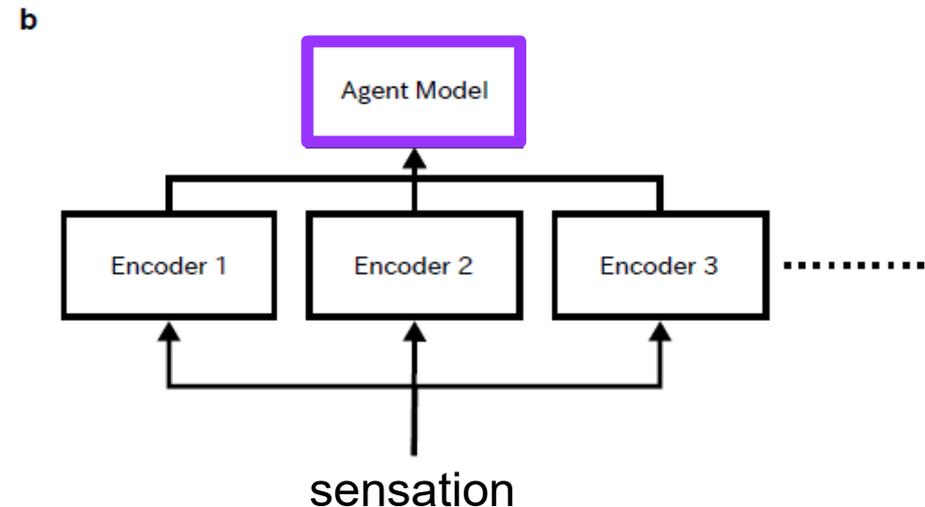

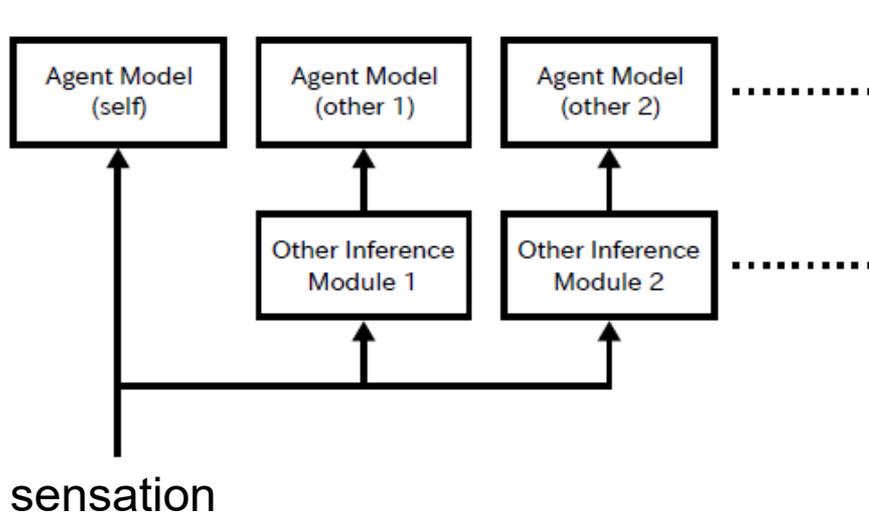

What mechanism makes it possible to learn and obtain the representations of self and other?

Anyone model that doesn't differentiate between self and others

Instead of creating models of others, we assume a single model for anyone without distinction between self and others.

Building a model of self and others **separately**

Building a **single** model that doesn't differentiate between self and others

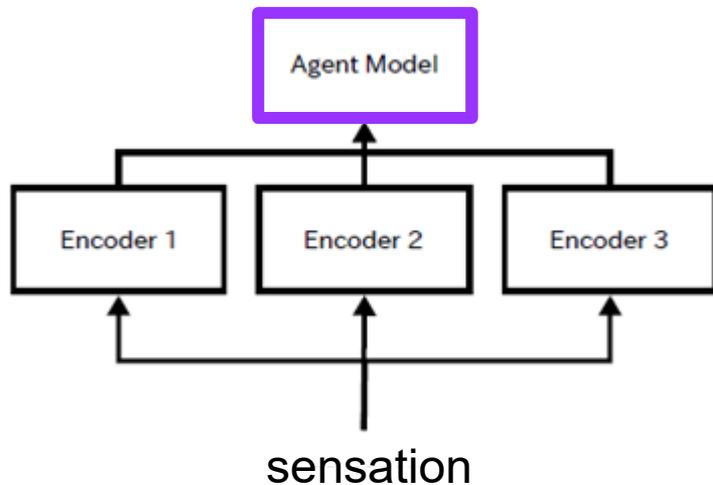

c.f. agent-neutral coding by Gordon (originator of ST)

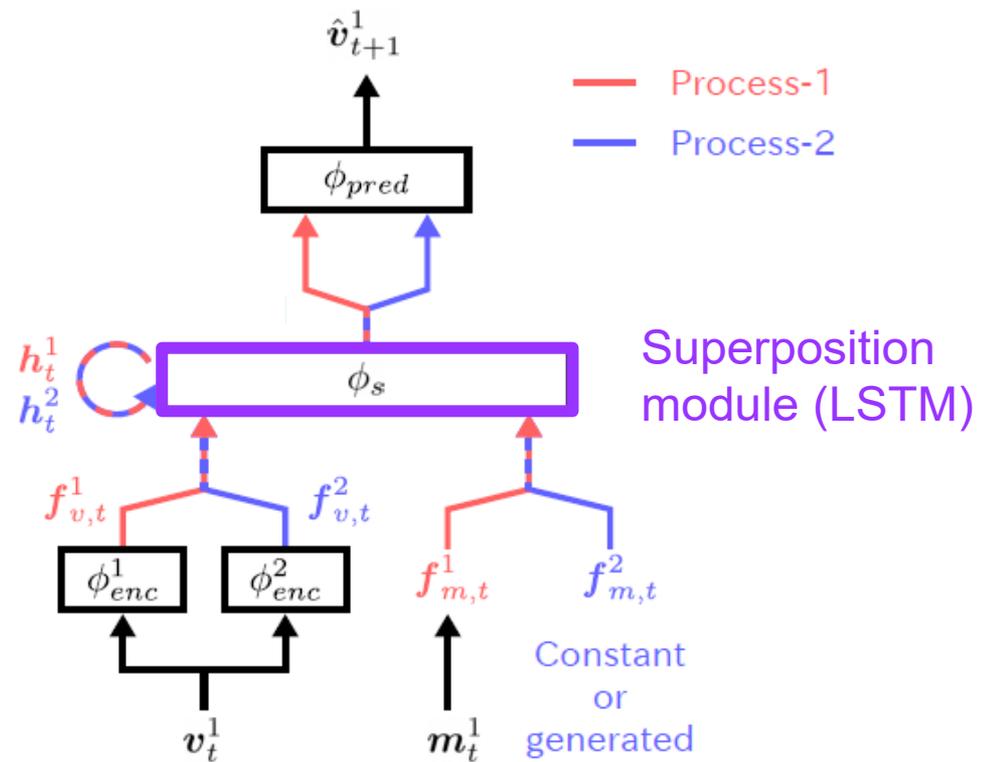

Gordon, R. M. (2021). Simulation, predictive coding, and the shared world. In *The Neural Basis of Mentalizing* (pp. 237-255).

Superposition network model

- Receiving own sensory (visual and somatosensory) inputs
- Multi-stream processing, process-1 and process-2
- Processed by a superposition module
- Integrating outputs of both processes to predict sensory inputs

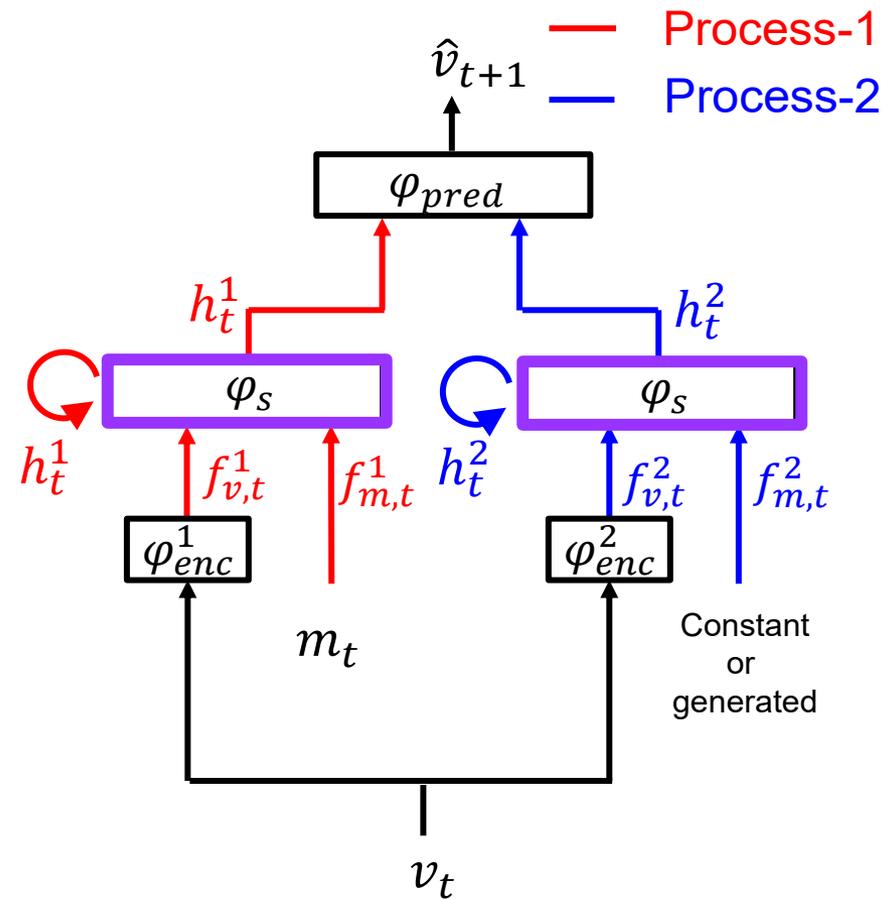

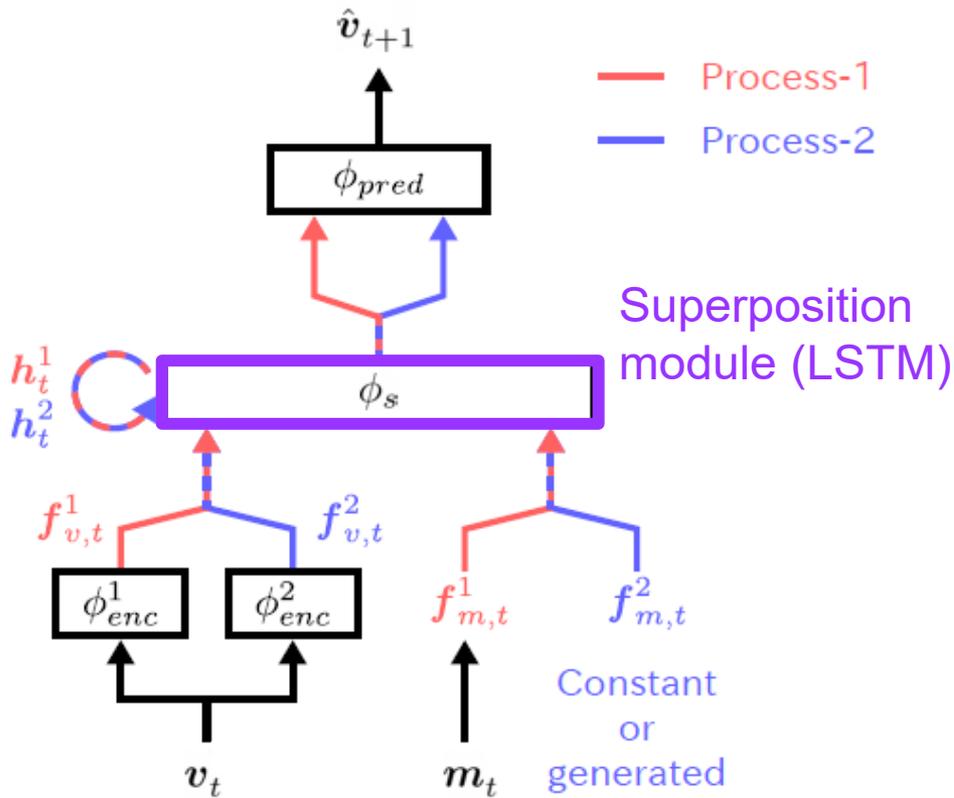

Anyone model (concept)

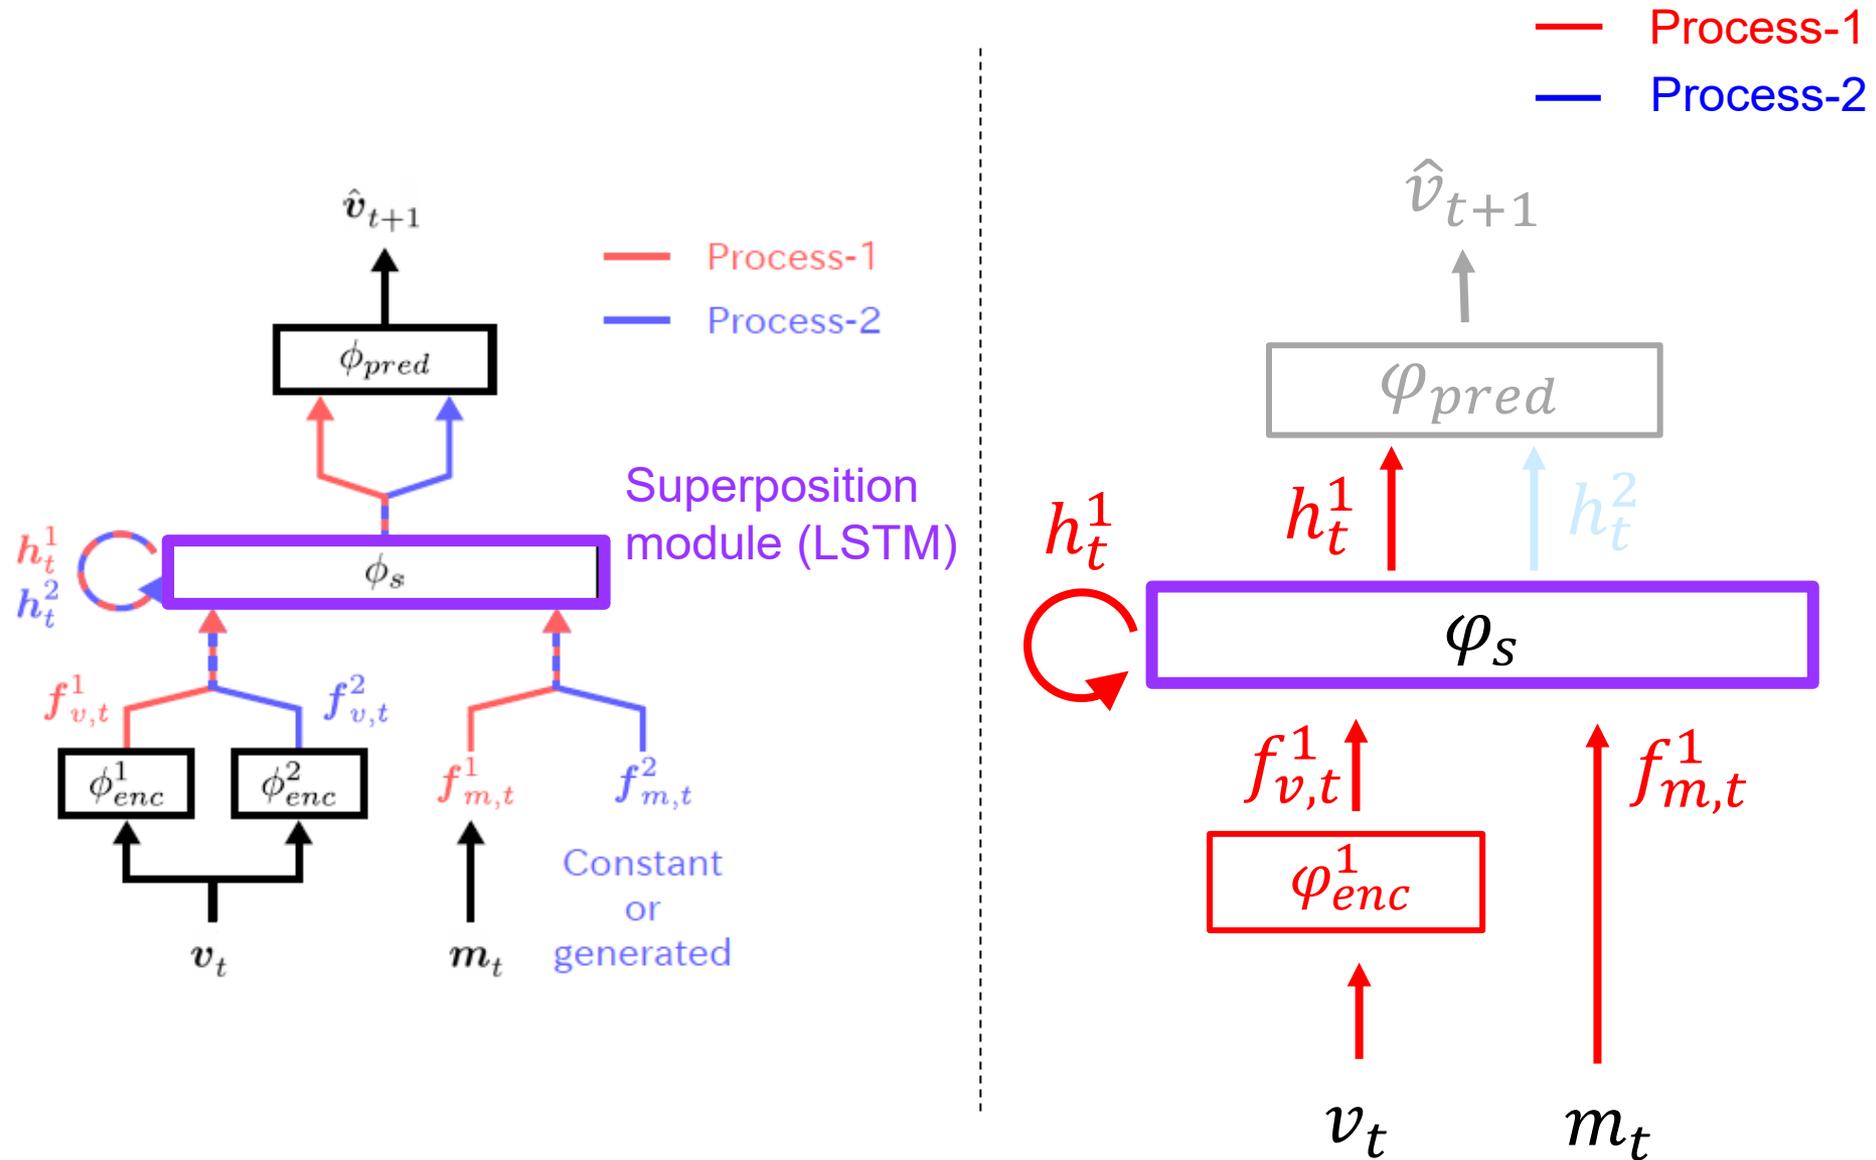

Superposition network model

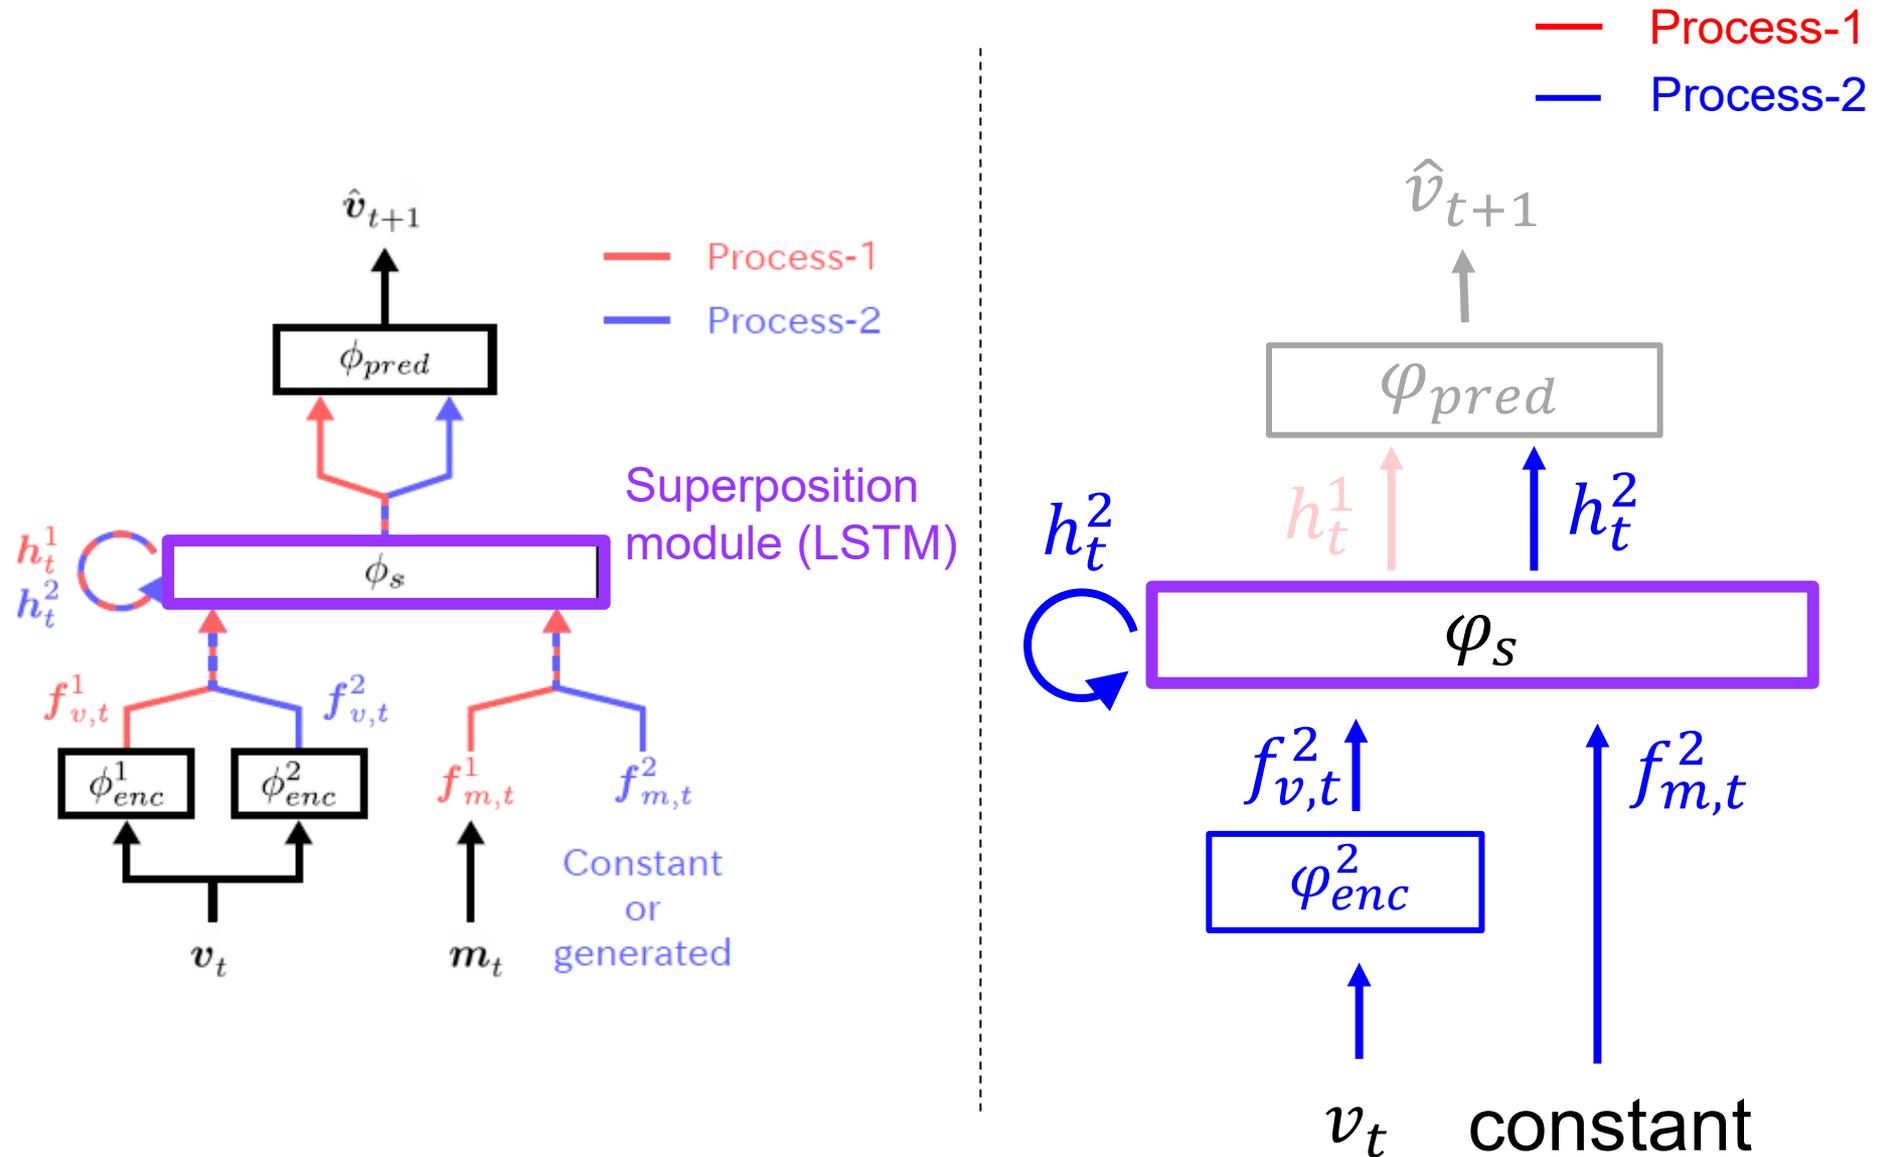

Another illustration form of our model

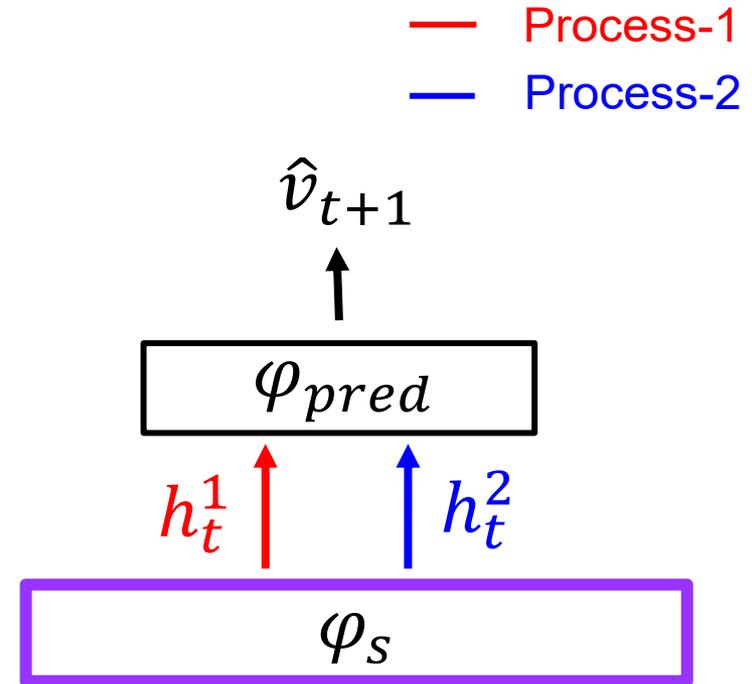

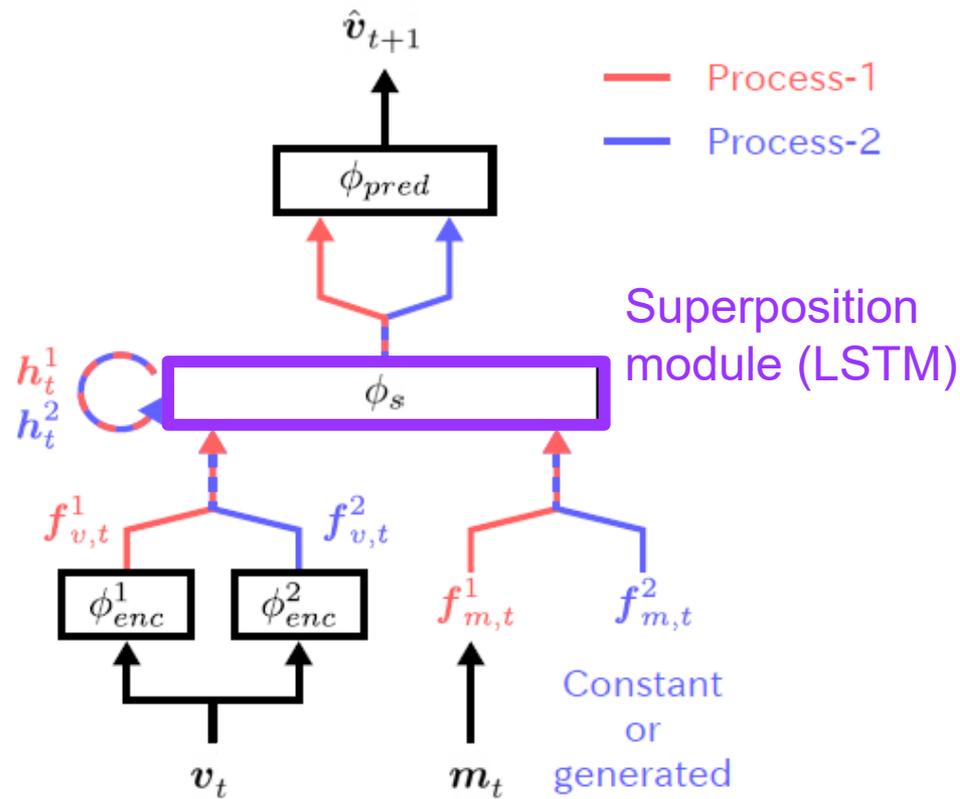

Another illustration form of our model

Another illustration form of our model

Predictive learning

The network is trained to minimize the prediction error for vision.

Loss function

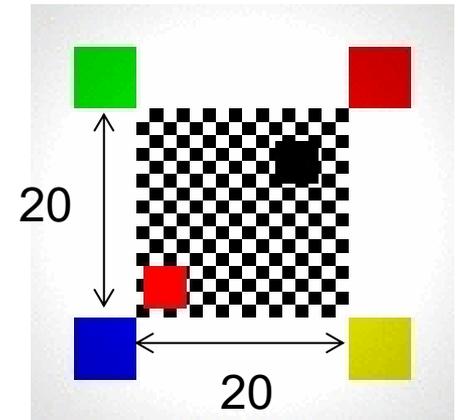

$$\mathcal{L}_{pred} = \sum_{t=1}^T \{ \lambda_{MSE} \text{MSE}(\hat{v}_{t+1}, v_{t+1}) + \lambda_{MAE} \text{MAE}(\hat{v}_{t+1}, v_{t+1}) \},$$

Simulation environment

■ : Agent-1 ■ : Agent-2

Agent-1 and agent-2 exist

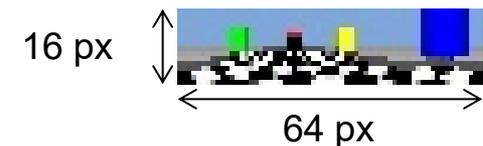

- Agent-1 moves around in the arena.
- Agent-2 does not move but change its locations every trial.

Agent-1:

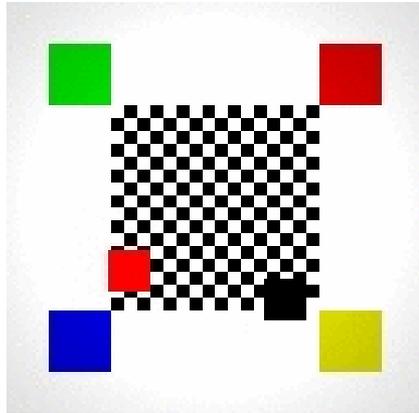

- Equipped with the superposition network
- Receiving visual images and proprioception
- Predicting future visual images

Agent-1's vision

Prediction performance

Visualizing internal states of SM

Example of agent-1's trajectory

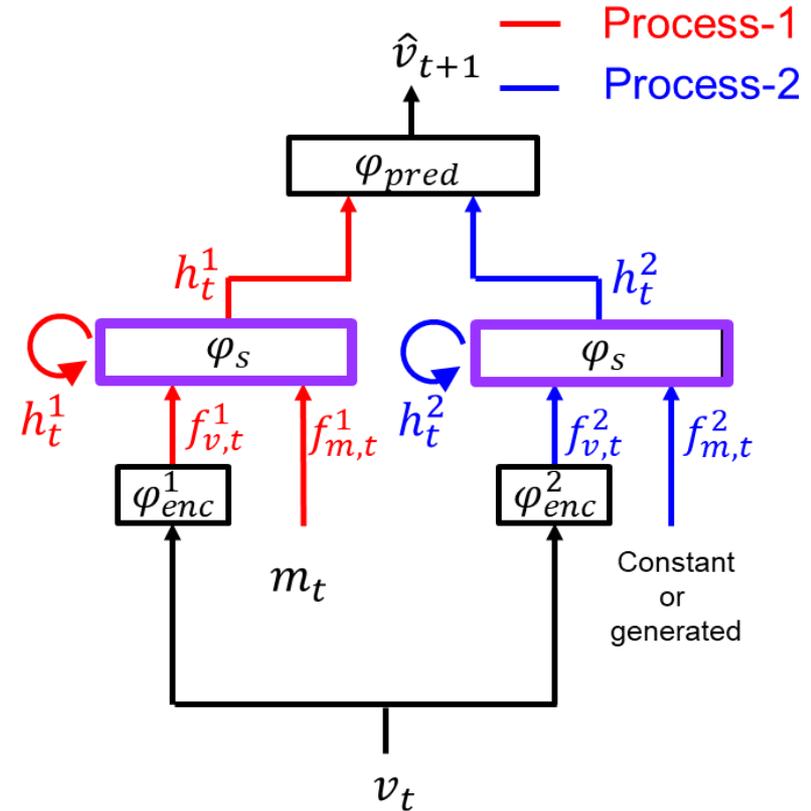

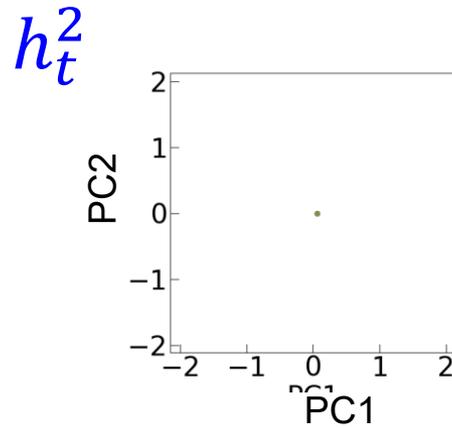

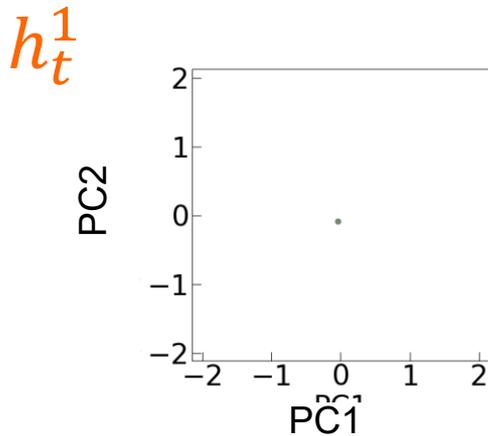

Coloring : agent-1's positions

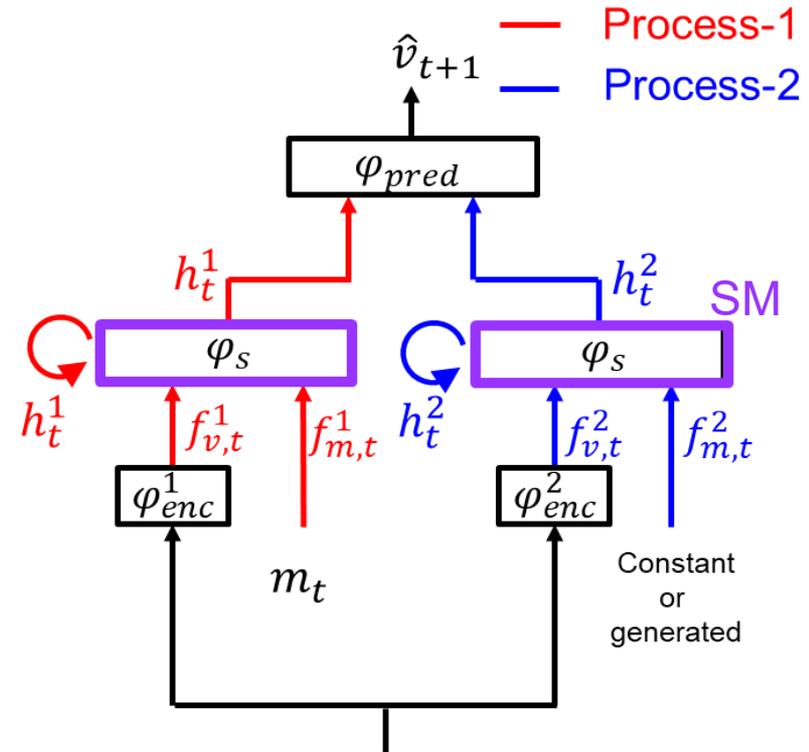

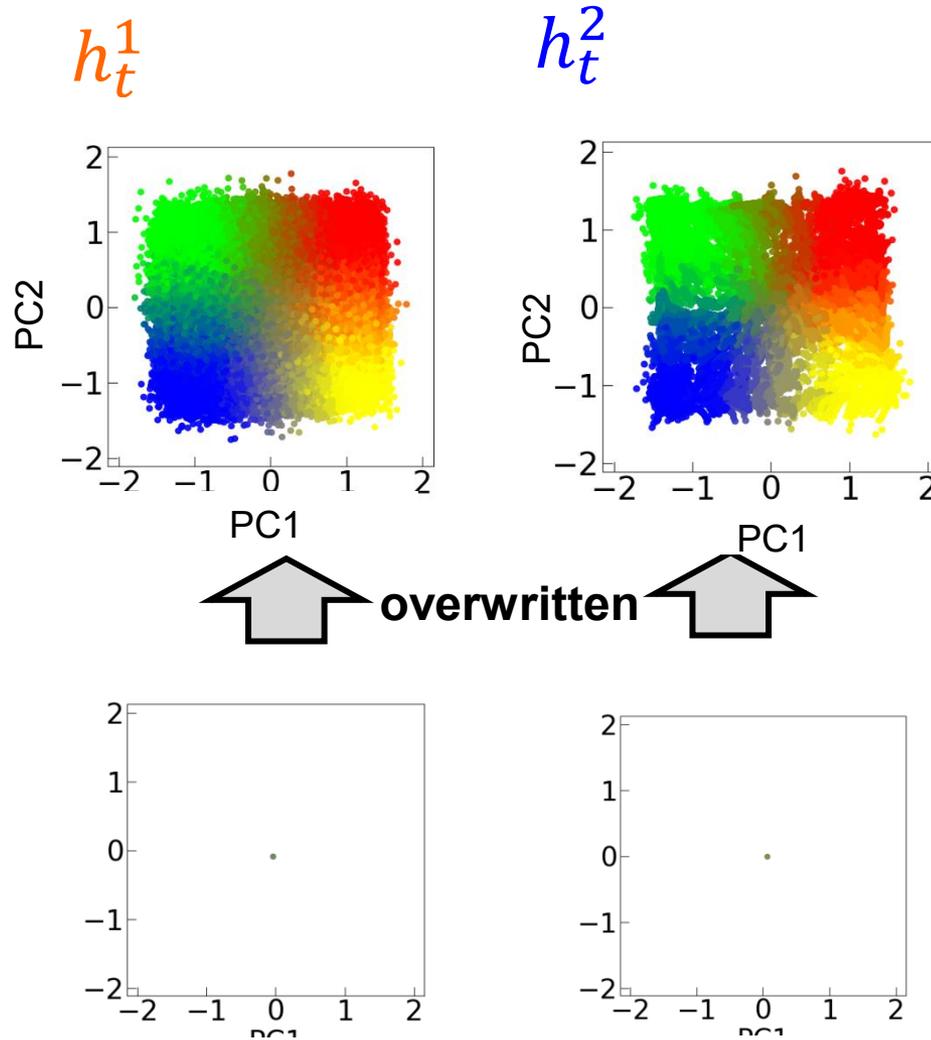

agent-2's positions

Visualizing internal states of SM

Visualizing internal states of SM

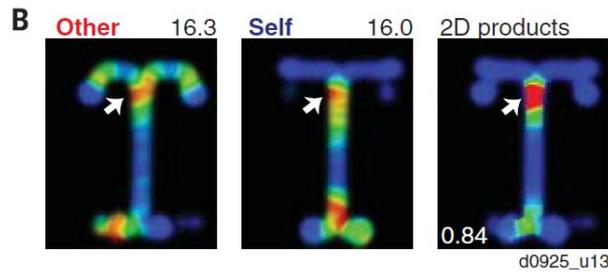

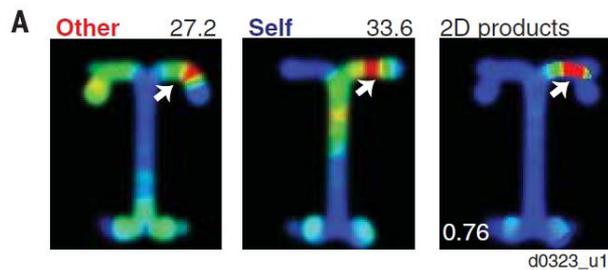

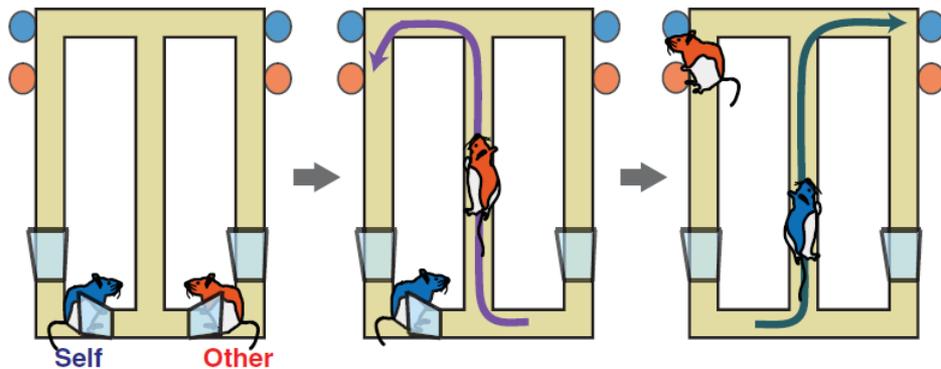

- The internal states of SM are activated in response to A-1 and A-2's positions.
- Similar to the social place cell found in neuroscience.

[Danjo, et. al, 2018, Omer, et. al, 2018]

Discovery of Social Place Cells

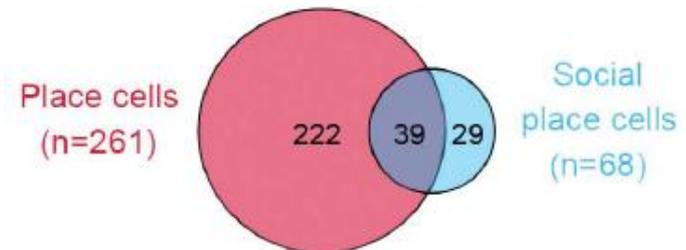

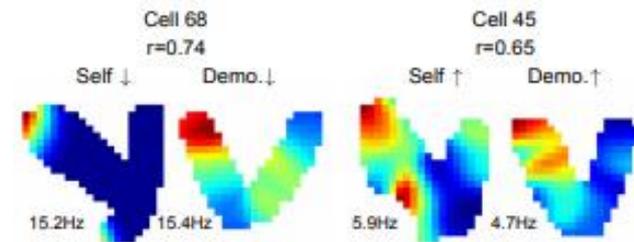

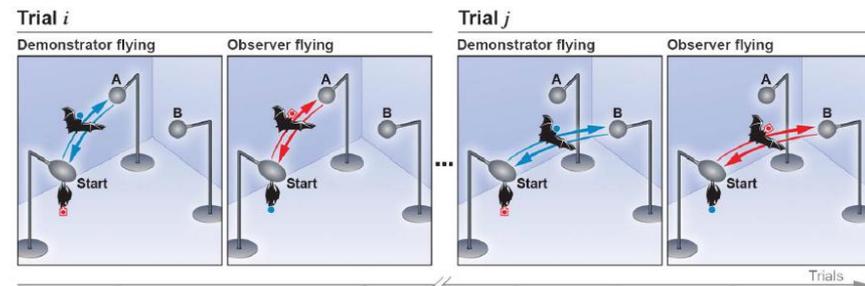

Spatial representations of self and other in the hippocampus

[Danjo et al., 2018]

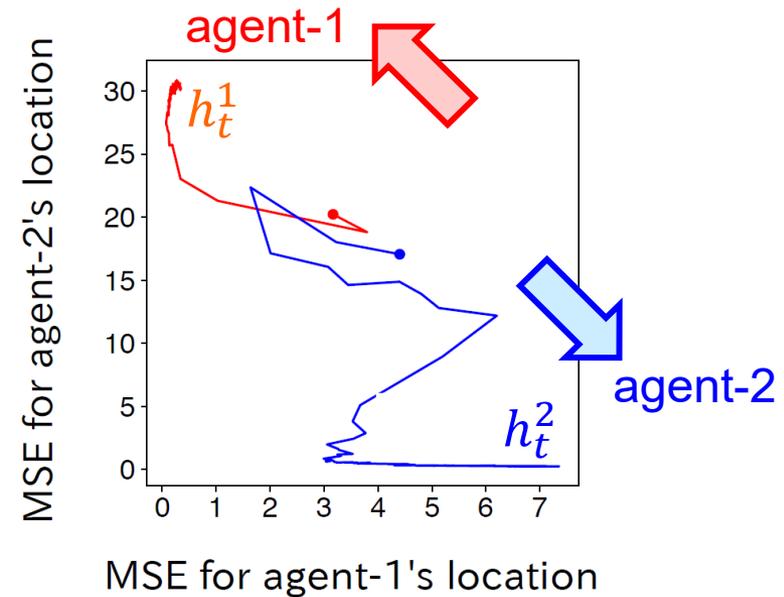

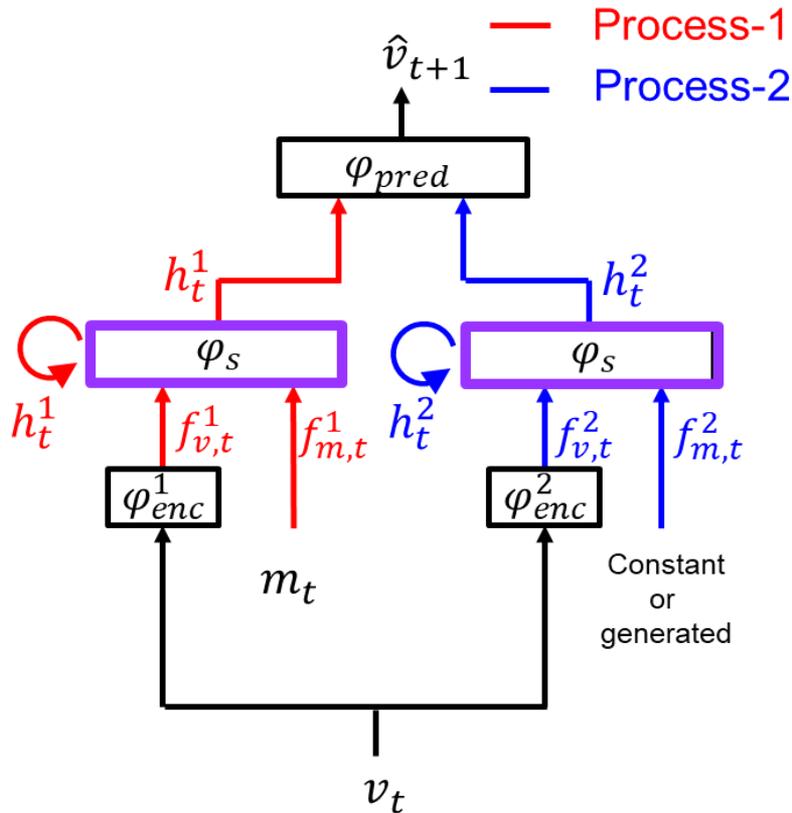

Social place-cells in the bat hippocampus

[Omer et al. 2018]

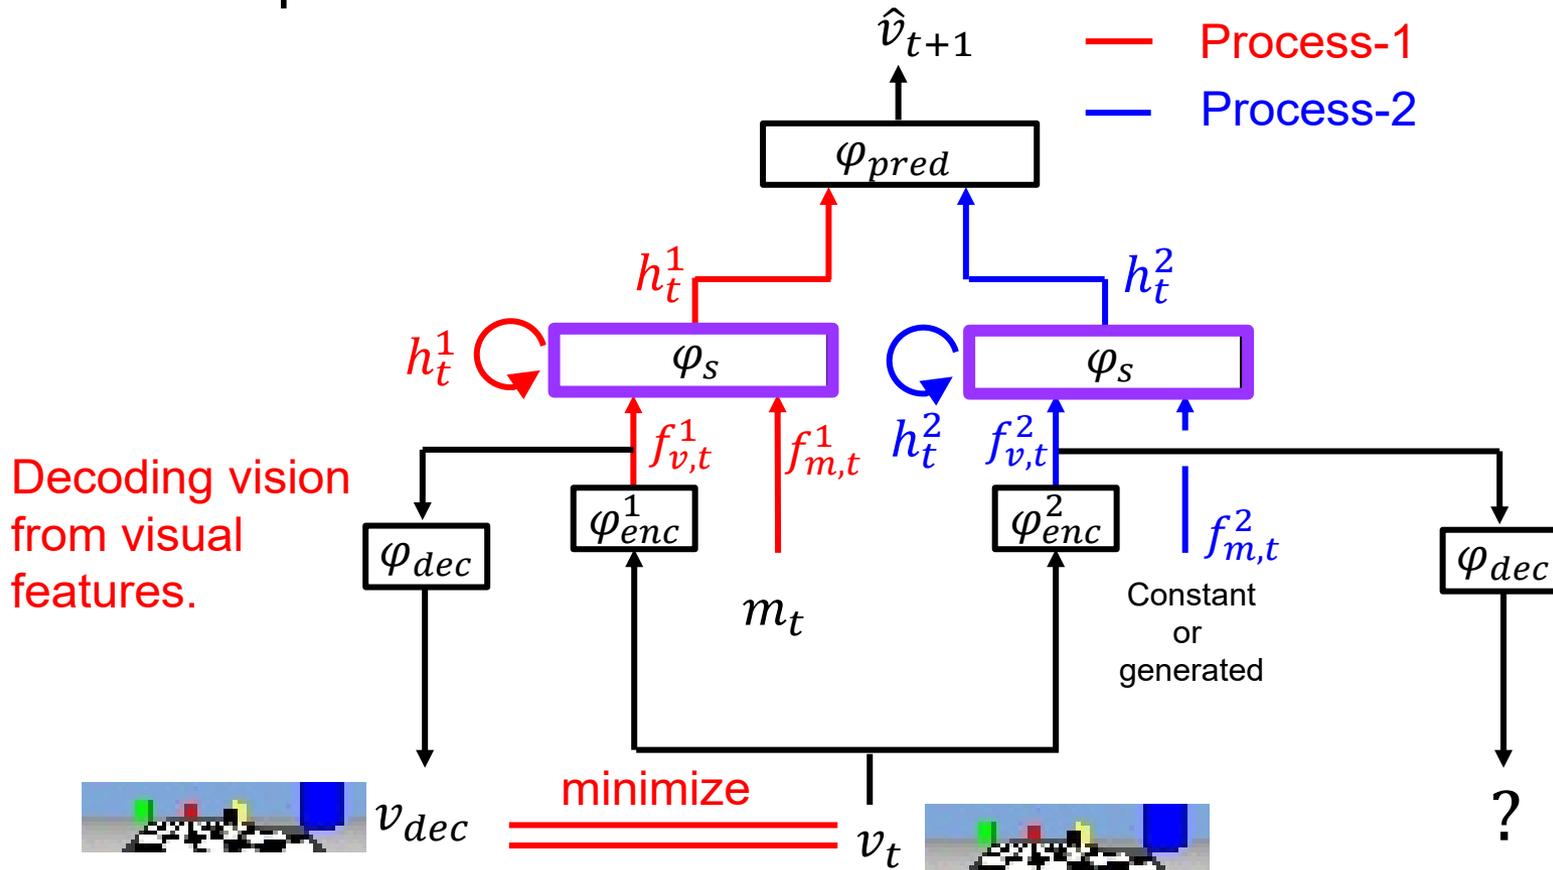

Self / other separation

Process-1 and -2 are gradually specialized to self and other, respectively. Process-1 handles information about self and process-2 handles information about other.

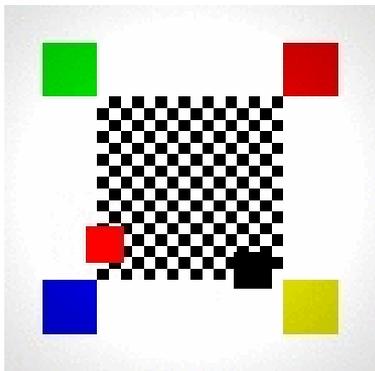

Visualizing what agent-1 sees

- Building a decoder to reconstruct the visual image from (own) visual features on process-1.
- Applying the decoder to the visual features on process-2 and visualize what it sees.

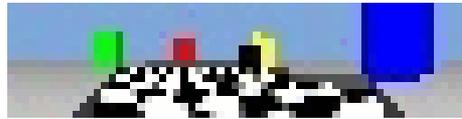

Visual perspective taking

Example 1

Decode

Just by using the superposition module, the agent can naturally obtain **other's perspective**.

Training motion generator

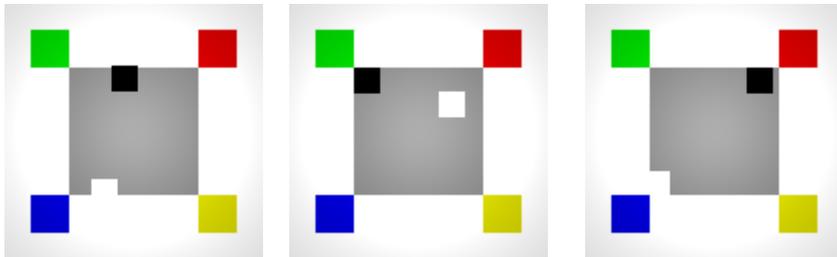

■ Agent-2 has intentions and begins to move

- Agent-2 moving around
- Adding a **motion generator (MG(LSTM))**
- Training the MG via predictive learning

(So far, only agent-1 was movable)

■ Three motion patterns of Agent-2

(Agent-1 : **Moving in a random way same as before**)

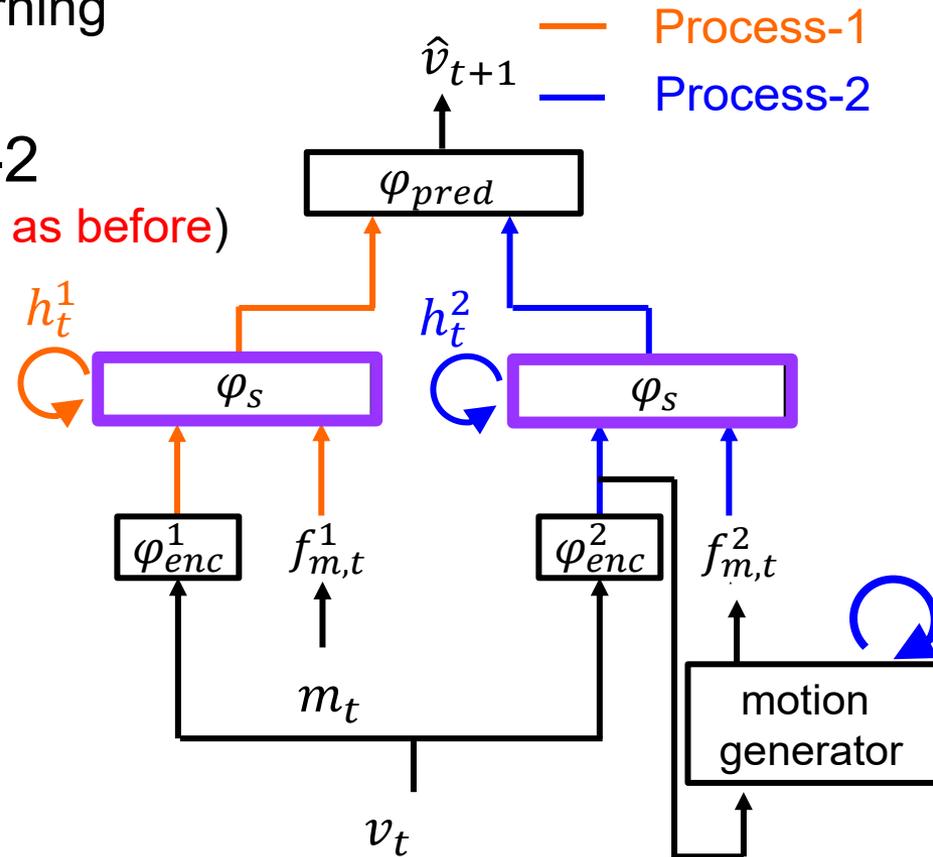

Stopping

CW

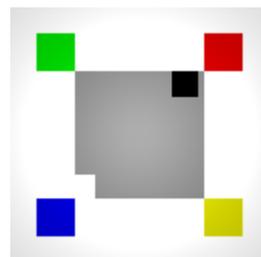

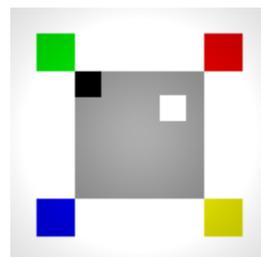

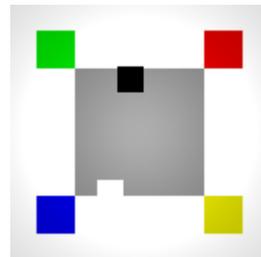

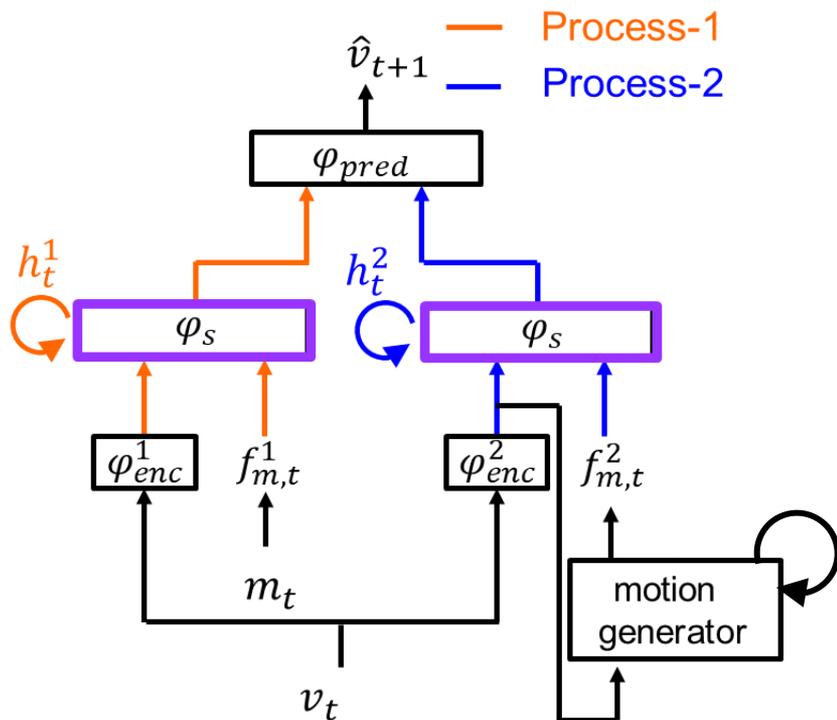

CCW

White : Agent-1 Black : Agent-2

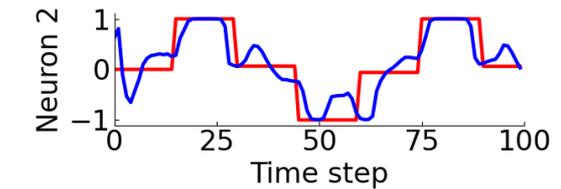

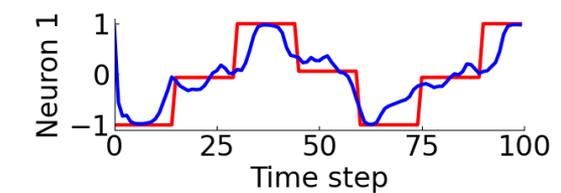

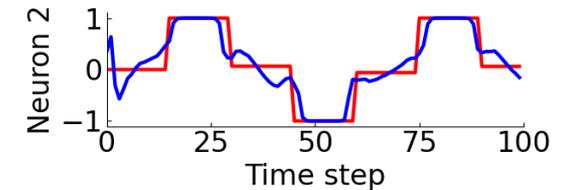

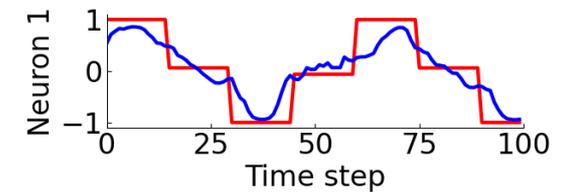

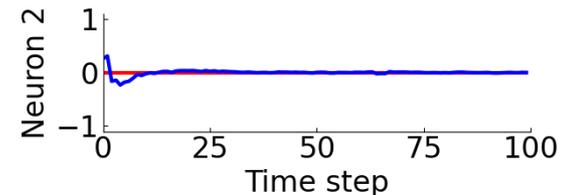

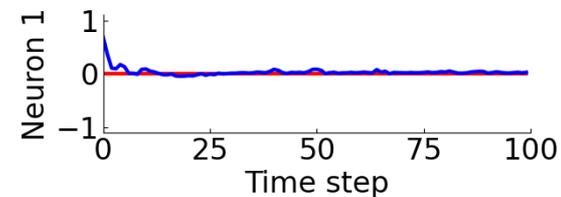

Mirror neuron-like activations

— Motion commands that create A-2's movements as if A-1 were A-2.

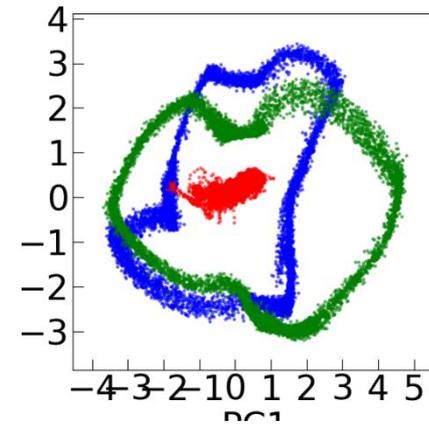

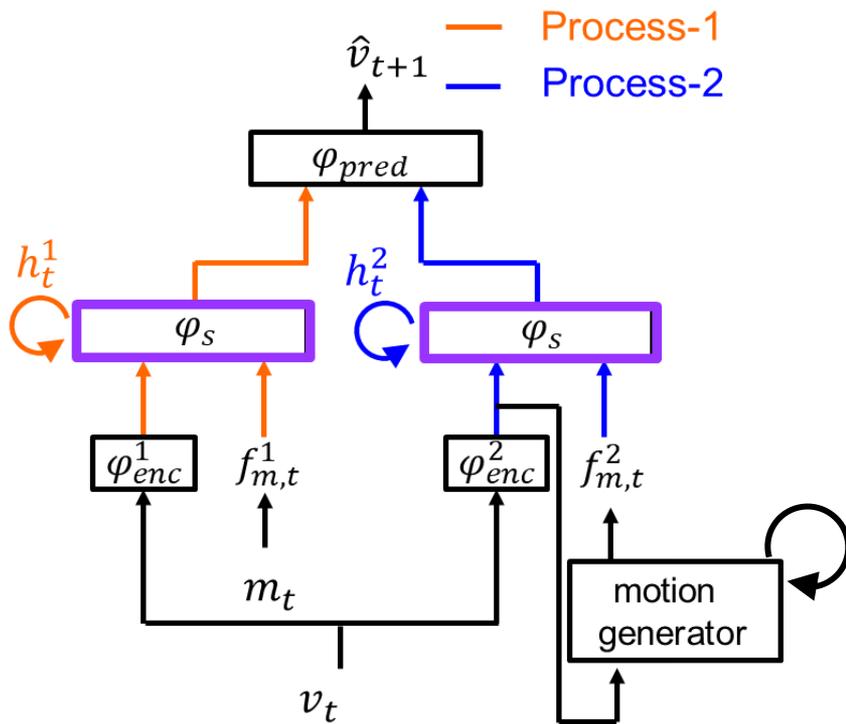

White : Agent-1
Black : Agent-2

- When observing agent-2, motions to generate agent-2's movements are internally created within agent-1.

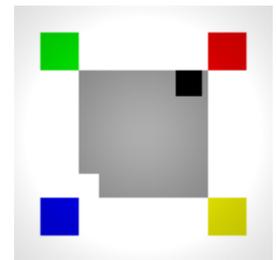

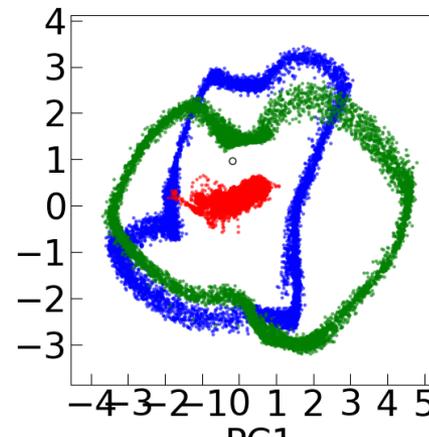

Internal states of motion generator as intentions of the other

- Visualizing the internal states of the motion generator by color-coding them for each action of Agent-2.

— Stopping
— CW
— CCW

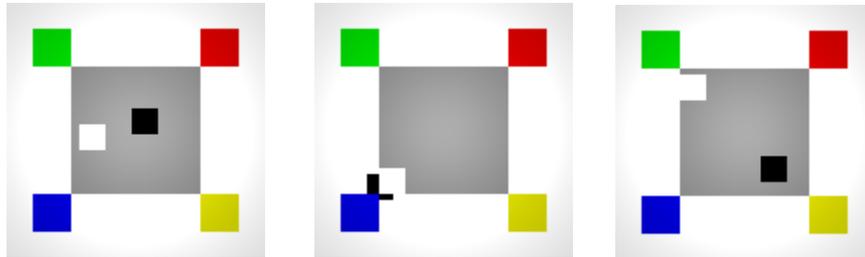

CCW

As a result, the attractors corresponding to the behavior patterns were formed.

Using MG of the other as self's

- Although these are patterns agent-1 has never moved in before, agent-1 tries moving in the three patterns

Stopping

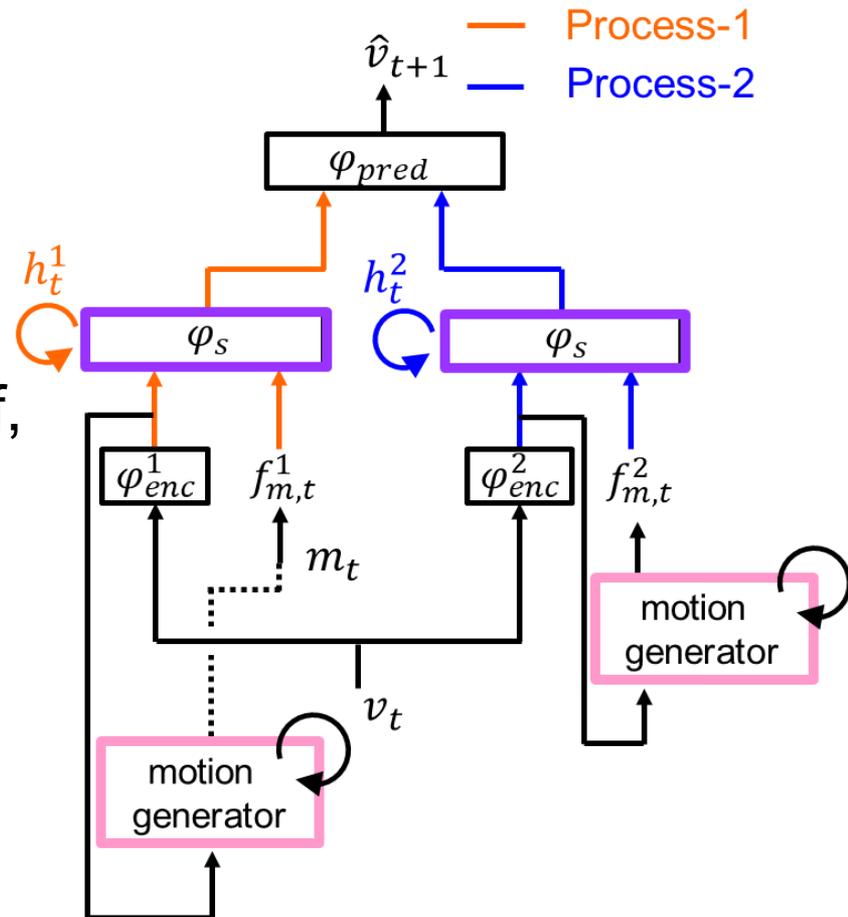

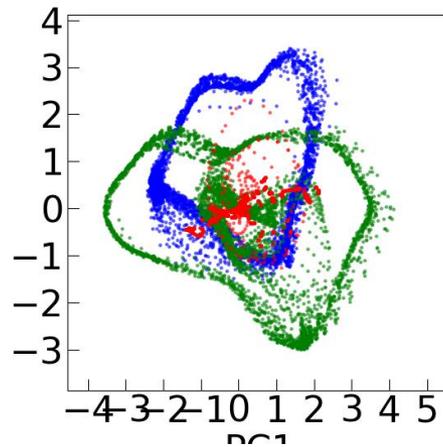

CW

CCW

White : Agent-1 Black : Agent-2

- Applying the MG of the other to self, visualizing the internal states same as before.

— Stopping
— CW
— CCW

Superposition mechanism (shared module network)
